\mathbb{S}_{mu}^{\wedge} Imagine maps: $\operatorname{Map}_{*}^{G}(A,B)$ $\operatorname{Map}_{*}^{G}(A,B)$ where $A, B \in \mathsf{Top}_*^G$. If $X \in \mathsf{Top}_*$ and $Y \in \mathsf{Top}$, we can form the spectra: $\Sigma^{\infty} X, \Sigma_{+}^{\infty} Y$ and for a spectrum $Z \in \mathsf{Sp}$, we can form the pointed space: **Theorem 1** (Pythagoras). $a^2 + b^2 = c^2$. Proof. Trivial **Lemma 2** (Zorn's Lemma). An poset $P \in Poset$ where all chains are bounded above has a maximal element. Proof. Axiom of choice. **Proposition 3.** $\sqrt[3]{2}$ is not a rational number. *Proof.* Suppose it was. Then, there will be two integers $a, b \in \mathbb{Z}$ such that $a^3 + a^3 = b^3$. We will need the following: **Theorem 4** (Fermat's Last Theorem, due to Andrew Wiles). The equation $a^n + b^n = c^n$ has no integer solutions when $n \geq 3$. Proof. Trivial [Theorem 4] \square We see that $\sqrt[3]{2}$ being rational produces a contradiction to Fermat's Last Theorem. Therefore, it must be irrational. [Proposition 3] \square

Claim 6. When $z \in \mathbb{C}$, we have that:

Proof. Duh

Remark 5 (Jordan curve theorem). It happens

$$e^z = e^{\Re(z)}(\cos \Im(z) + i\sin \Im(z))$$
